Anyaa Internship Assignment: Household Meal-Planning Voice Agent

The challenge

Design and build a voice agent for the household kitchen. The agent serves two kinds of people: the household, who decide what gets eaten, and the cook, who makes it happen every day. It plans meals with the household, turns the plan into groceries (ordered on Instamart or sent as a message), and then helps the cook carry the plan out day to day. There is no single right answer - one agent, multiple agents - your call. We want to see how you think about real families, real kitchens and real mistakes.

What we expect

The agent has two jobs. We expect a working end-to-end flow for each, even if rough:

1. **Plan with the household.** A voice conversation that produces a meal plan for everyone in the household, a consolidated grocery list, and a final step where the household orders on Instamart or receives the list by message.
2. **Execute with the cook.** The agent works with the cook on a daily basis to carry out that meal plan.

You choose the tools, models and stack. Integrations you cannot access can be simulated, as long as you are clear about what is real and what is not.

Duration

You have 24 hours to submit, counted from the moment you receive this email. If you need more time, let us know.

What to submit

- A working demo: a live prototype or a short recorded walkthrough with demo (under 10 mins).
- Your code, with a README that explains how to run it. You can share a zipfile.
- A short write-up (about one page) covering your key decisions, trade-offs, what you left out on purpose, and what you would do next.

How we will evaluate

We care more about judgment than polish, and we will not hand you a checklist of what to consider. We are looking at:

- **Depth of thinking:** how far you take the problem on your own, how well does the planning engine work.
- **Personality:** whether the agent has a voice and character of its own.
- **Realism:** how real it sounds to the people using it.
- **Complex households:** how well it handles messy, real-life household scenarios.
- **Evaluations:** how do you ensure agents remain performant against expectation.

We expect to see a working system. It doesn't have to be perfect, but it should work. What we are most interested in seeing is how deep an understanding you can build about such a deceptively simple problem - from planning meals to execution with the cook.

What happens after the submission

We evaluate each submission, and if your submission meets our bar, we do a live interview with the founders for the final decision.
